

SURYA PRASAD SENTHILKUMARAN

My name is Surya Prasad Senthilkumaran, and I'll be taking CSE 543: Computer Security this Fall semester.

I did my undergrad in CSE from Amrita University, Coimbatore, India. While I concentrated on Networks and Deep Learning during my study (published a paper on Classification of Neurological Disorders based on Facial Emotion Recognition and EEG data, in Springer), I aim to carry out research in Distributed Systems and Cloud Computing.

As for my prior experience, I have worked with Network Security concepts such as GRE encapsulation, tunneling and 802.1q encapsulation in Ethernet links, as well as SHA256 hashing and other software encryption algorithms during my 4-year stint at Cisco Systems.

I seek to understand security at a grassroots level. Since my goal is to be a Distinguished Engineer, I can see myself designing software systems and I wish to do so with an emphasis on security. While I might not pursue a career explicitly in security, it will be an essential part of my day-to-day responsibilities.

As for the issues with Computer Security, three issues that I would like to highlight are:

- Quantum Computing and its potential to break existing algorithms
- Lack of frameworks to ensure a basic level of security. Security driven development practices are not enforced as much as they should be
- Education of the general public so that they are well informed to identify and carry out their part of ensuring security on an individual level.
